

## Release Notes

TO: TransAM Users

DATE: December 21, 2019

TOPIC: TransAM Version 2.8.0

---

The following memorandum describes the new features and fixes that have been released to the TransAM platform. This release consists of new features, and fixes.

### **Platform Improvements - General:**

- The default sorting of order table data has been updated for consistency.
- A message sent view has been added to the Message History table within the Client Admin interface.
- Improvements have been made to the TAM Service Life Summary report to make sure organizations with different 'Active' TAM Policy years are accurately depicted. This means, within the TAM Service Life Summary report, analysis for each organization will be based off the most recent year the organization has an 'Active' TAM Policy.
- The Infrastructure (Underlying Data) export of the TAM Service Life Summary report has been updated to more accurately reflect speed restrictions across multiple asset records.
- The current year has been added to the 'Capital Projects' widget on the dashboard.
- The older support guide, depicted as '?' on the top right of the site has been replaced with an 'Updates' section. New release notes will be added to this link for download as part of each new system release. Upon initial post release login by a user, the user will receive a notification that the system has a new release and the release notes can be downloaded.
- Asset date related validations have been updated to make sure the 'Purchase Date', 'In Service Date', and 'Service Status Date' fields cannot accept dates that may be inconsistent with the correct chronological order of purchase, addition to service, and annual updates or status.

### **Platform Improvements – NTD Related:**

- Updates have been made to the A-20 form to accurately depict linear asset calculations.
- Updates have been made to the 'Valid in Fleet' flag within the Fleet Builder tool.

- The TAM Policy has been updated to allow for TAM Policies from prior years to be editable, so long as the individual organizations policy has not been activated. Please note, this is a short-term measure, and additional updates will be made in a future release to improve the overall workflow.

#### **Bug Fixes:**

- The 'Type' data field was missing from all Infrastructure asset tables.
- When filtering for the Manager and Staff user roles on the Users table, duplicate values were appearing.
- On the login screen some images along with the credentials section were adjusting in size unnecessarily.
- The available 'Models' were missing in the 'Model' filter within the 'Manage Fleets' section of the Fleet Builder.
- There were several errors in the 'Export All' feature for asset tables to include misalignment of column headers and associated data values, data display inconsistencies, and unnecessary data columns. These issues have been addressed.
- The Manager user role for Grantor organizations could not review early asset disposition requests or record assets for final disposition. This has been fixed, and the Manager user role for Grantor organizations now has the same permissions as the Asset Manager user privilege.
- When editing a user role for some existing users, the change was not saving.
- The history log data entries for asset disposition and review were not depicting all actions correctly.
- For some clients, when updating asset mileage with the bulk maintenance template, validation of data regarding mileage was not consistently processed and the error language was not provided in an easy to understand format.
- For some assets, users were unable to edit the 'Secondary Mode(s)' field without erroring.
- Some client instances included unnecessary site-wide organization filters, which have now been removed.
